Housing 2000: Strong & Steady

By Kolie Sun Chang, Senior Research Analyst, DECD

ousing is an important sector of the overall economy and housing statistics are among the leading indicators in measuring economic performance.

Housing Market Built on a Solid Ground

According to the latest data from the Office of Policy and Management (OPM), and calculated by the Connecticut Policy and Economic Council (CPEC), average home sale prices for 1999 have returned to the high point reached at the peak of the 1980s real estate boom in 1989. Current values, unlike those of the 80's, are based on consistent stable growth. The period of 1996 through 1999 saw an average growth rate of approximately five percent that tracked slightly ahead of the rate of inflation for that same period. In contrast, the period of 1986 to 1989 exhibited a dramatic (and as we know now, artificial) increase in values of approximately 39 percent, from

\$144,477 in 1986 to \$200,256 in 1989. This increase outpaced the rate of inflation significantly and proved to be unsustainable as evidenced by the real estate crash of the late '80s.

The Connecticut Association of REALTORS, Inc. recently released its 2000 Connecticut Housing Affordability Index (HAI) with a reading of 1.38 that means, on average, Connecticut families had 138 percent of the income required to purchase the average priced single-family home last year. The U.S. HAI was 1.30, 8 index points below that of Connecticut. In other words, "Connecticut housing affordability shows that housing here still offers considerable value for investors with a longterm time horizon," according to Don Klepper-Smith of Centerprise Advisors, Inc. in New Haven.

1990 vs. 2000 Census

According to the Census report "Profile of General Demographic Characteristics for

Housing Occupancy: 1990 vs. 2000

	1990	2000	Unit Chg	% Chg
Population	3,287,116	3,405,565	118,449	3.6%
Housing Units		1,385,975	65,125	4.9%

Website: http://www.state.ct.us/ecd/research

Connecticut: 2000," there were 1,385,975 housing units in the State, and 93.9 percent of the units were occupied housing. This ratio is comparable to the 1990 level of 93.2 percent. Within the occupied housing units, 66.8 percent were owneroccupied compared to 65.6 percent in the 1990 Census. In other words, the number of homeowners increased by over 62,000 during the last ten years. (See table on the front page.)

The rate of increase in housing units outpaced the State's population, growing 4.9 percent versus a 3.6 percent growth in population. Thus there were 2.46 persons per housing unit in 2000 compared to 2.49 in 1990.

Connecticut's inventory of residential dwelling units, as estimated by the Connecticut Department of Economic and Community Development (DECD), the lead agency for housing in Connecticut, was 1,399,819 at the end of 2000. The estimate was based on a net gain of 78,969 housing units authorized from January of 1991 through December of 2000, added to the base of 1,320,850 housing units reported in the 1990 Census. The DECD's estimate is within one percent of the Census 2000 official estimate. Beginning next year, DECD will use the 2000 estimate as the base for future inventory estimation until the next decennial census.

Total Production, Demolition and Net Gain

The Census Bureau recently released the 2000 housing authorization data, and reported that 9,376 new dwelling units were issued for Connecticut, the fourth highest number of permits since 1990. Among them, 8,158 units were for single-family homes with the remainder, 1,218, for multi-unit dwellings.

Although the Census Bureau discontinued the collection of

demolition permits, DECD has surveyed each municipality to obtain this information. Of Connecticut's 169 municipalities. 155 towns responded to our survey and reported 1,790 units demolished. Demolitions in five large cities--Hartford, Bridgeport, New Haven, Waterbury and New Britain--accounted for 42 percent of the total. Based on the reported data, there was a net increase in housing units leveled of 7,586 for the year.

Counties

The largest three counties in the State--Fairfield, Hartford and New Haven--accounted for 63 percent of the new residential permits issued in 2000. The same three counties accounted for almost 68 percent of all the permits issued in 1990. This suggests the three counties' combined share of new permits is shrinking while the rest of the State has increased its share of residential housing production activities.

In terms of the new permit growth rate, Middlesex County experienced a 115 percent increase from 403 units issued in 1990 to 867 units in 2000. Tolland County followed with a 94 percent gain from 358 units to 693 units authorized. Fairfield and New London Counties followed with 40 percent and 6 percent increases, respectively. Hartford and New Haven Counties both staved at the same level, while Litchfield and Windham Counties declined in new permit authorizations.

Conclusion

In summary, 2000 housing permit levels showed strong and steady growth in housing construction in Connecticut. Favorable interest rates, growth in population, and a continued demand for housing in a growing economy were factors in this positive pattern.

DECD

RESEARCH

Hartford Leads in Jobs, as Stamford Tops in Wages in 2000

By Jungmin Charles Joo and Dana Placzek, Research Analysts, DOL

he table on the next page profiles all of Connecticut's 169 cities and towns using five economic indicators for 2000. Below are brief highlights from the latest annual average data prepared by the Connecticut Department of Labor's Office of Research.

Labor Force

Stamford had the biggest resident labor force of 67.565, while the smallest was in Union with 408 persons. Among the State's largest cities, New Haven had the greatest growth in its labor force, 3.5 percent over the year.

Unemployment Rate

Hartford's 4.8 percent was the highest unemployment rate last year, but this was a significant drop from 6.4 percent in 1999. Sharon posted the lowest jobless rate of 0.7 percent. The statewide rate dropped from 3.2 in

1999 to 2.3 in 2000.

Establishments

Stamford continues to have the largest number of business establishments, with over 5,200 units in 2000. But the city's number of businesses has declined since 1998.

Employment

Hartford, Bridgeport, and Waterbury were among 61 cities and towns that experienced employment losses over the year. New Haven and Stamford were among those that added jobs.

Wages

In 2000, the highest annual wage of \$90,625 was paid to employees of firms located in Stamford, a 17.6 percent increase from the previous the year. The statewide average was \$45,406 per worker, a 6.5 percent increase over **1999.** ■

HOUSING UPDATE

Permits Nearly Keep Pace...

ommissioner James F. Abromaitis of the Connecticut Department of Economic and Community Development announced that Connecticut communities authorized 841 new housing units in May 2001, a 2.5 percent decrease compared to May of 2000 when 863 units were authorized.

The Department further indicated that the 841 units permitted in May 2001 represent an increase of 8.0 percent from the 779 units permitted in April 2001. The yearto-date permits are down by 1.8

percent, from 3,804 through May 2000, to 3,736 through May 2001.

Hartford Labor Market Area (LMA) recorded the largest number of new authorized units in May with 337. New Haven and Bridgeport LMAs followed with 91 and 79 units respectively. Bristol led all Connecticut communities with 20 units, followed by Shelton with 19 and Hamden, Newtown and Southington tied at 18. From a county perspective, Hartford County showed the largest gain (25 units) in new housing authorizations compared to a year ago.

For more information on housing permits, see tables on pages 23 and 26.

Industry Clusters

Statewide Call

he DECD and FleetBoston Financial, in conjunction with the Initiative for a Competitive Inner City (ICIC), are looking for candidates to attend the Connecticut **Inner City Executive Education** Alliance program.

An innovative initiative, the Connecticut Inner City Executive Education Alliance program will provide approximately 20 inner city business owners or their senior level managers with the advanced business skills needed to gain a competitive advantage in the New Economy. Course participants will pay one-third of the tuition, and will receive a one-third tuition reduction from the participating university. Fleet will underwrite the remaining tuition cost.

The Inner City Executive Education Alliance will provide participants with access to challenging executive education business workshops at some of the nation's most prestigious universities.

Connecticut is considered a national leader for its commitment to strategically reinvesting in its urban centers, and the creation of the Alliance is an integral part of Governor Rowland's multi-faceted Inner City Business Strategy. The Alliance will serve as the model for ICIC's 2002 national executive education program.

Please contact Andrea Austin-Thompson at (860) 270-8062 for applications. For more information on the Connecticut Inner City Executive Education Alliance, visit www.decd.org or www.youbelonginct.com, or send an e-mail request to andrea.austinthompson@po.state.ct.us.

Gross State Product Grew 4.7 Percent in 1999

By Jungmin Charles Joo, Associate Research Analyst, DOL

n 1999, Connecticut's real **Gross State Product (GSP)** grew by 4.7 percent over the year, ranking fourth in New England, and 17th in the nation. That was about the same pace of growth as in 1998 (4.6 percent). Real GSP grew by 6.3 percent in New England and 5.0 percent in the United States in 1999.

GSP, produced by the Bureau of Economic Analysis of the U.S. Department of Commerce, is the market value of all goods and

services produced in a state, and is the state counterpart of the nation's Gross Domestic Product (GDP). Real GSP is adjusted for inflation and is expressed in 1996 dollars.

In 1999, Connecticut's real GSP was estimated at \$145 billion, the second highest dollar amount among the New England states, next to Massachusetts' \$252 billion. After a high of 8.5 percent in 1987, the State's economic growth slowed dramati-

cally in 1989 and declined in 1990 and 1991. There has been steady economic growth in Connecticut since 1992.

The finance, insurance & real estate (FIRE) and services sectors made up nearly half of Connecticut's total real GSP in 1999, and their share of the total output rose from 1986 to 1999. Conversely, the manufacturing sector, third largest in terms of output, experienced a slight decline in the share of the total GSP between 1986 and 1999. ■

Ask the *Digest*

By Jungmin Charles Joo, Associate Research Analyst, DOL

Question: What is the difference between "nonfarm employment" and the "employed"?

Answer: The "nonfarm employment" estimates (published on pages 8 and 16 through 21 in this publication) are derived from a sample of more than 5,000 Connecticut employers. As a payroll survey, this data reflects the number of jobs that exist based on where the jobs are located.

The estimates of the "employed" (which appear on page 8 under the "Unemployment" section and on page 22) are produced based on a statistical model which incorporates a monthly survey of about 500 State households. This sample is a part of the national Current Population Survey (CPS). The data reflect the number of persons who are working, based on where they live.

As the name suggests, agricul-

tural employees are not included in the "nonfarm employment" estimates, but are counted in the "employed" estimates. Additionally, the self-employed and unpaid family workers are included among the "employed," but not in nonfarm employment. For a more complete discussion of this subject, see "Defining Employment" on pages 3 and 4 of the May 1999 Digest.

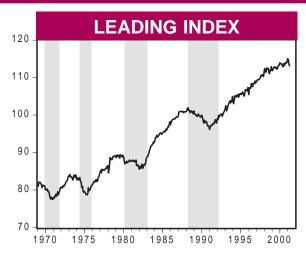

So, "nonfarm employment" counts each job once, while the "employed" counts each individual once. This may not seem significant, until we consider that about six percent of employed individuals in the State are multiple job holders. In other words, if every employed individual in the State took a second job, and no new persons became employed, the number "employed" would

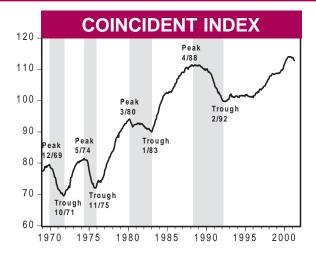

not change, but "nonfarm employment" could double! This is because the number of jobs would increase, but the number of employed persons would remain the same.

In general, the "nonfarm employment" numbers present a good picture of the current job situation. The "employed" data are valuable for analyzing trends in the employment status of persons in the labor force, classified by such characteristics as age, sex, race, and occupation.

WE WANT YOUR QUESTIONS!

Please e-mail your questions to dol.econdigest@po.state.ct.us. Thank you!

The distance from peak to trough, indicated by the shaded areas, measures the duration of an employment cycle recession. The vertical scale in both charts is an index with 1992=100.

Are Dark Clouds Thickening Over Connecticut?

he U.S. economy continues to show signs of slowing. Real GDP grew 1.3% in the first quarter of 2001 (preliminary annual rate), far below the 5.0% growth rate of 2000. The civilian unemployment rate, however, edged down to 4.4% in May from 4.5% in April. The latest Beige Book Report, which is an informal survey of economic conditions in the twelve Federal Reserve districts, shows little change or decelerating economic activities in April and May. Inflation, measured by the Consumer Price Index and the Producer Price Index, in spite of rising energy costs, continues to be mild, rising by 0.4% and 0.1%, respectively, in May. The continued weakness in the economy and the tame inflation rate may provide room for a further interest rate cut by the Federal Reserve at the next FOMC meeting on June 26 and 27.

The Connecticut economy also shows signs of slowing. The **CCEA-ECRI** Connecticut leading and coincident employment indexes both registered a decline in April on a year-to-year basis. The coincident employment index fell from 113.2 a year earlier to 112.8 in April 2001. Contributing to the decline are a higher insured unemployment rate and lower total employment. Two other components contributed positively to the index, however, with a lower total unemployment rate and higher total nonfarm employment. On a sequential month-to-month basis, this is the third consecutive decline, and the fifth decline in the last six months for the coincident employment index.

The leading employment index fell from 113.6 in April 2000 to 113.1 in April 2001. This is the second consecutive decline for this index on a year-to-year basis. Five components of this index contributed to the decline, with lower average weekly hours worked in manufacturing and construction, a lower Hartford help-wanted advertising index, lower total housing permits, a higher short duration (less than 15 weeks) unemployment rate, and higher initial claims for unemployment insurance. The sole positive contributor to this index is the Moody's Baa corporate bond yield, which fell from 8.40% a year

earlier to 8.07% in April 2001. Compared to last month, one additional component this month, average weekly hours worked in manufacturing and construction, is contributing to the decline of the leading employment index on a year-to-year basis. On a sequential month-to-month basis, this is also the third consecutive decline for this index.

The signals that these two indexes send suggest that we may be at the beginning of a slowdown in the Connecticut economy. This should not surprise anyone, however, since Connecticut is not immune from the national economy. The Federal Reserve has aggressively cut interest rates five times already this year, totaling 250 basis points. The national economy should feel the effects of these rate cuts by the end of this year. Also, Congress has recently passed a tax-cut plan, which should also help to revive the slowing economy. There is a good chance that there will not be a recession in the U.S. And if so, there is also a high probability that Connecticut will not experience a recession.

Francis W. Ahking, Department of Economics, University of Connecticut, Storrs, CT 06269. Phone: (860) 486-3026. SOURCE: Connecticut Center for Economic Analysis, University of Connecticut. Leading and coincident employment indexes were developed by Pami Dua and Stephen M. Miller, in cooperation with Anirvan Banerji at the Economic Cycle Research Institute. Stan McMillen [(860) 486-3022, Storrs Campus] provided research support. Components of Indexes are described in the Technical Notes on page 27.

UI Covered Employment Sets New Record, Wage Growth Continues

By Edward T. Doukas Jr., Research Analyst, DOL

reliminary figures recently released for the fourth quarter of 2000 (4Q00) show that Connecticut Unemployment Insurance (UI) covered employment grew by 22,340, an increase of 1.3 percent over the same period of the previous year (see table below). The employment total registered during

4Q00 was the highest on record for the period, inching past the previous high set in 1988 by 1.0 percent.

The total number of units also increased (+1.6%) over the year. The average weekly wage for Connecticut workers was \$950 during 4Q00, up 2.7 percent from the previous year's \$925.

The unemployment insurance program provides a comprehensive source of employment and wage data by industry and geographic area for workers covered by the State's UI law. These data differ in a number of ways from the those that appear monthly in the Digest as "nonfarm employment" and "manufacturing worker hours and earnings. The UI data represent universe counts and offer greater geographic and industry detail. They are available by calendar quarter five-tosix months after the end of the quarter that they reference. The more timely monthly data are developed from a sample survey and are published about three weeks after the end of the month to which they apply.

The Connecticut Economy's General Drift Indicators are composite measures of the four-quarter change in three coincident (Connecticut Manufacturing Production Index, nonfarm employment, and real personal income) and four leading (housing permits, manufacturing average weekly hours, Hartford help-wanted advertising, and initial unemployment claims) economic variables, and are indexed so 1986 = 100.

The People's Bank Business Barometer is a measure of overall economic growth in the state of Connecticut that is derived from non-manufacturing employment, real disposable personal income, and manufacturing production. The index is calculated by DataCore Partners, Inc for People's Bank.

The Connecticut Business Climate Index assesses the current economic conditions and the future expectations of the business community in the State. The Index has a maximum score of 100, meaning that all businesses in the State are completely confident with the current economic conditions and in the future of the economy and job market.

Total nonfarm employment increased by 6,300, or 0.4 percent, over the year.

LABOR FORCE CONCEPTS

The civilian labor force comprises all state residents age 16 years and older classified as employed or unemployed in accordance with criteria described below. Excluded are members of the military and persons in institutions (correctional and mental health, for example).

The employed are all persons who did any work as paid employees or in their own business during the survey week, or who have worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, strike or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs.

The unemployed are all persons who did not work, but were available for work during the survey week (except for temporary illness) and made specific efforts to find a job in the prior four weeks. Persons waiting to be recalled to a job from which they had been laid off need not be looking for work to be classified as unemployed.

^{**}The Bureau of Labor Statistics has identified these five towns as a separate area to report labor force data. For the convenience of our data users, data for these towns are included in the Torrington LMA. For the same purpose, data for the town of Thompson, which is officially part of the Worcester, MA MSA, is included in the Danielson LMA.

LABOR FORCE CONCEPTS (Continued)

The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

With the exception of those persons temporarily absent from a job or waiting to be recalled to one, persons with no job and who are not actively looking for one are counted as "not in the labor force".

Over the course of a year, the size of the labor force and the levels of employment undergo fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays and the opening and closing of schools. Because these seasonal events follow a regular pattern each year, their influence on statistical trends can be eliminated by adjusting the monthly statistics. Seasonal Adjustment makes it easier to observe cyclical and other nonseasonal developments.

BUSINESS STARTS AND TERMINATIONS

Registrations and terminations of business entities as recorded with the Secretary of the State and the Connecticut Department of Labor (DOL) are an indication of new business formation and activity. DOL business starts include new employers which have become liable for unemployment insurance taxes during the quarter, as well as new establishments opened by existing employers. DOL business terminations are those accounts discontinued due to inactivity (no employees) or business closure, and accounts for individual business establishments that are closed by still active employers. The Secretary of the State registrations include limited liability companies, limited liability partnerships, and foreignowned (out-of-state) and domestic-owned (in-state) corporations.

CONSUMER PRICE INDEX

The Consumer Price Index (CPI), computed and published by the U.S. Bureau of Labor Statistics, is a measure of the average change in prices over time in a fixed market basket of goods and services. It is based on prices of food, clothing, shelter, fuels, transportation fares, charges for doctors' and dentists' services, drugs and other goods and services that people buy for their day-to-day living. The Northeast region is comprised of the New England states, New York, New Jersey and Pennsylvania.

EMPLOYMENT COST INDEX

The Employment Cost Index (ECI) covers both wages and salaries and employer costs for employee benefits for all occupations and establishments in both the private nonfarm sector and state and local government. The ECI measures employers' labor costs free from the influences of employment shifts among industries and occupations. The base period for all data is June 1989 when the ECI is 100.

HOURS AND EARNINGS ESTIMATES

Production worker earnings and hours estimates include full- and part-time employees working within manufacturing industries. Hours worked and earnings data are computed based on payroll figures for the week including the 12th of the month. Average hourly earnings affected by such factors as premium pay for overtime and shift differential as well as changes in basic hourly and incentive rates of pay. Average weekly earnings are the product of weekly hours worked and hourly earnings.

INDIAN GAMING DATA

Indian Gaming Payments are amounts received by the State as a result of the slot compact with the two Federally recognized tribes in Connecticut, which calls for 25 percent of net slot receipts to be remitted to the State. Indian Gaming Slots are the total net revenues from slot machines only received by the two Federally recognized Indian tribes.

INITIAL CLAIMS

Average weekly initial claims are calculated by dividing the total number of new claims for unemployment insurance received in the month by the number of weeks in the month. A minor change in methodology took effect with data published in the March 1997 issue of the DIGEST. Data have been revised back to January 1980.

INSURED UNEMPLOYMENT RATE

Primarily a measure of unemployment insurance program activity, the insured unemployment rate is the 13-week average of the number of people claiming unemployment benefits divided by the number of workers covered by the unemployment insurance system.

LABOR FORCE ESTIMATES

Labor force estimates are a measure of the work status of people who live in Connecticut. Prepared under the direction of the U.S. Bureau of Labor Statistics, the statewide estimates are the product of a multiple variable coefficient regression model, which uses results from the Current Population Survey (CPS), a monthly survey of Connecticut households, counts of claimants for unemployment benefits, and establishment employment estimates. Due to the small size of the sample taken in Connecticut, the CPS results are subject to significant sampling error and produce considerable month-to-month fluctuations in estimates derived from the sample. In general, the CPS estimates, at the 90 percent confidence level, have an error range of about 1.5 percentage points on a rate of 6.0 percent. An accepted method for calculating the error range for model estimates is currently not available. Labor force data, reflecting persons employed by place of residence, are not directly comparable to the place-of-work industry employment series. In the labor force estimates, workers involved in labor disputes are counted as employed. The labor force data also includes agricultural workers, unpaid family workers, domestics and the self-employed. Because of these conceptual differences, total labor force employment is almost always different from nonfarm wage and salary employment.

LABOR MARKET AREAS

All Labor Market Areas in Connecticut except three are federally designated areas for developing labor statistics. Industry employment data for the Danielson, Lower River and Torrington Labor Market Areas are prepared exclusively by the Connecticut Department of Labor, following the same statistical procedures used to prepare estimates for the other Labor Market Areas, which are developed in cooperation with the U.S. Department of Labor, Bureau of Labor Statistics.

The Bureau of Labor Statistics has identified the five towns of Canaan, Kent, North Canaan, Salisbury and Sharon as a separate area for reporting labor force data. For the convenience of our data users, data for these towns are included in the Torrington Labor Market Area. For the same purpose, data for the town of Thompson, which is officially part of the Worcester Metropolitan Statistical Area, are included in the Danielson Labor Market Area. Also, data for Hopkinton and Westerly, Rhode Island are included in the New London Labor Market Area.

LEADING AND COINCIDENT EMPLOYMENT INDICES

The leading employment index is a composite of six individual largely employment-related series -- the average workweek of manufacturing production and construction workers, Hartford help-wanted advertising index, short-duration (less than 15 weeks) unemployment rate, initial claims for unemployment insurance, total housing permits, and Moody's BAA corporate bond yield. While not employment-sector variables, housing permits are closely related to construction employment and the corporate bond yield adds important information about the movement in interest rates. The coincident employment index is a composite indicator of four individual employment-related series -- the total unemployment rate, nonfarm employment (employer survey), total employment (state residents employed measured by a household survey), and the insured unemployment rate. All data are seasonally adjusted and come from the Connecticut Labor Department, the Federal Reserve Bank of Boston, and the Board of Governors of the Federal Reserve System.

NONFARM EMPLOYMENT ESTIMATES

Nonfarm employment estimates are derived from a survey of businesses to measure jobs by industry. The estimates include all full- and parttime wage and salary employees who worked during or received pay for the pay period which includes the 12th of the month. Excluded from these estimates are proprietors, self-employed workers, private household employees and unpaid family workers. In some cases, due to space constraints, all industry estimates are not shown. Call (860) 263-6275 for a more comprehensive breakout of nonfarm employment estimates.

UI COVERED WAGES

UI covered wages is the total amount paid to those employees who are covered under the Connecticut's Unemployment Insurance (UI) law for services performed during the quarter. The fluctuations in the 1992-93 period reflect the effect of the changes in the tax law and the massive restructuring in the state's economy.
